

MOSQUITO AND BLACK FLY CONTROL

I have been involved with biting fly control across Canada since 1983. Our two main problems are mosquitoes and black fly. In fact, there are some Canadians who think that the black flies should replace the beaver as our national symbol.

I was looking for a trap that had the attractive components that would work on both mosquitoes and black flies. Most of the traps already on the market either didn't work or didn't meet my expectations when it came to catching mosquitoes. None claim to catch black flies. In my opinion, the Mosquito Management System used all the attractants currently known to science and should do the job in reducing populations of black flies and mosquitoes.

I set up a trial in Labrador, probably one of the most notorious places in Canada for mosquitoes and black flies. The results were impressive; the traps caught literally thousands of mosquitoes and black flies. I was convinced that this would be the best product on the market for people who wanted to reduce the numbers of biting flies around their homes.

Since that trial I have heard from a number of homeowners and cottagers who are completely satisfied with the performance of the Mosquito Management System, which we call the mosQUITO Black Fly Trap in Canada. It doesn't catch them all but it certainly reduces the numbers dramatically.

West Nile virus has crossed from the U.S into Ontario and will likely spread though out southern Canada. Mosquitoes transmit this disease. The use of the Trap will reduce the risk of contracting the disease around the home, cottage or resort area. People who have the traps can rest easier knowing that they have taken extra measure to keep their families safe.
